## Live Beautiful. Live Green.

Bamboo is one of the world's best sustainable resources. It can grow up to a meter or more per day and fully matures within 5 years. Bamboo takes in nearly 5 times the amount of greenhouse gases and produces 35% more oxygen than an equivalent stand of trees, making it an efficient replenisher of fresh air. Expanded polystyrene (styrofoam) and plastics can take centuries to biodegrade, and coated paper products can take decades. Only bamboo-based products begin biodegrading immediately upon entering the soil. By promoting the growth and utilization of bamboo, we can begin to limit the negative impact we have on Earth's environment.

### The Process

The process begins by taking the fiber of bamboo plants that are 5 years or older and grinding it into a fine powder. Utilizing a proprietary process, we mold this material into the sturdy, long-lasting items featured in our BambooWare line. We retain all the strength and beauty of traditional plastic materials such as Melamine, but with the added benefits of sustainability -- our bowls, plates, cups and utensils are all 100% biodegradable, all natural bamboo and dishwasher safe.

### More Bamboo Info

Each piece of our BambooWare line is FDA approved food safe and can withstand even the toughest industrial dishwashers. For the first time, BambooWare combines the eco-conscious decision to purchase dinnerware made from Earth-friendly bamboo plants with the natural desire to own dinnerware that is stylish, colorful and fun.
